Continuation of 11. does NOT place the application in condition for allowance because: it is still held that the prior art of record meets the positively recited claim limitation. As noted in the rejection, Benderev et al. discloses a handle, but it is not removable from the body, wherein the device as a whole is an assistive device for accessing a surgical site and performing a procedure. At least claim 1 requires a handle with a 'teceiving structure' that corresponds to an 'attachment structure' to a template, further being configured to selectively receive. In addition to a handle being well known in the art for assisting in a task, namely by providing a larger diameter for facilitated gripping, the handle in at least claim 1 requires only the above items. A receiving structure can be a hole, and an attachment structure when the providing the prior of the providing a larger diameter for sections that the handle 22 as a breaking device for shortening the pin at one of the notches. However, that handle still is capable of providing relative attachment to the pin, or as claimed, a template, Fig. 8 of Neufeld does not show (see hidden lines) that the handle has a loose connection to the pin. Also, even if the pin is connected to the handle even through the sleeve 23, it still is being configured to selectively receive the attachment structure such that the at least one template is releasably encageable with the handle.
